Project Design Phase-I: Problem-Solution Fit Canvas

Field	Details
Date	02 November 2026
Team ID	N/A (Individual Project)
Project Name	EV Value & Longevity Analytics Dashboard
Prepared by	Piyush Malviya
Maximum Marks	2 Marks

The Problem-Solution Fit canvas checks that the solution matches a real need of a specific customer.

Box	Content
1. Customer Segment(s)	Fleet procurement managers, EV pricing and product analysts, and sustainability leads in organisations that buy or sell EVs.
2. Jobs-to-be-Done / Problems	Compare EV categories on price, range, battery life and safety; benchmark manufacturers; justify purchase or pricing decisions.
3. Triggers	Annual fleet renewal, a new EV model launch, budget review, or a rise in fuel and maintenance costs.
4. Emotions: Before / After	Before: unsure, worried about overpaying, overloaded by data. After: confident, able to defend the choice with evidence.
5. Available Solutions	Manufacturer brochures, raw spreadsheets, generic market reports, paid analyst subscriptions.
6. Customer Constraints	Limited time, no data-science skills, fixed budget, need a result that finance can accept.
7. Behaviour	Copy figures into spreadsheets by hand, compare only sticker price, rely on brand reputation.
8. Channels of Behaviour	Online: supplier sites, shared spreadsheets, email. Offline: purchasing committee meetings, dealer visits.
9. Problem Root Cause	There is no common value measure (cost per km of range) and no single view that links price, range, battery life and safety.
10. Your Solution	A nine-chart Tableau dashboard and five-chapter story built on a Value Index and a battery longevity comparison, published on the web.

Fit Check

- Problem: lack of a comparable value measure. Solution: Value Index by category.
- Problem: worry about battery replacement. Solution: cycle life and degradation by chemistry.
- Problem: too much data. Solution: filters, a top-10 manufacturer view, and a short story.
